

## 30 V signal Schottky diode

### Features

- Very low conduction losses
- Negligible switching losses
- 0201 package
- Low capacitance diode
- ECOPACK<sup>®</sup>2 and RoHS compliant

### Applications

- Reverse polarity protection
- Fingerprint module
- Camera module
- Bluetooth wireless earbud
- Biometric computer card

### Description

The **BAT30F4** uses 30 V Schottky barrier diodes in a 0201 package. This device is intended to be used in smartphones, and is especially suited for rail to rail protection where its low forward voltage drop will help designers to get an efficient protection of their ICs.

## 2 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com). ECOPACK® is an ST trademark.

Note: The marking codes can be rotated by 90° or 180° to differentiate assembly location. In no case should this product marking be used to orient the component for its placement on a PCB. Only pin 1 mark is to be used for this purpose.

### 3 Recommendation on PCB assembly

#### 3.1 Stencil opening design

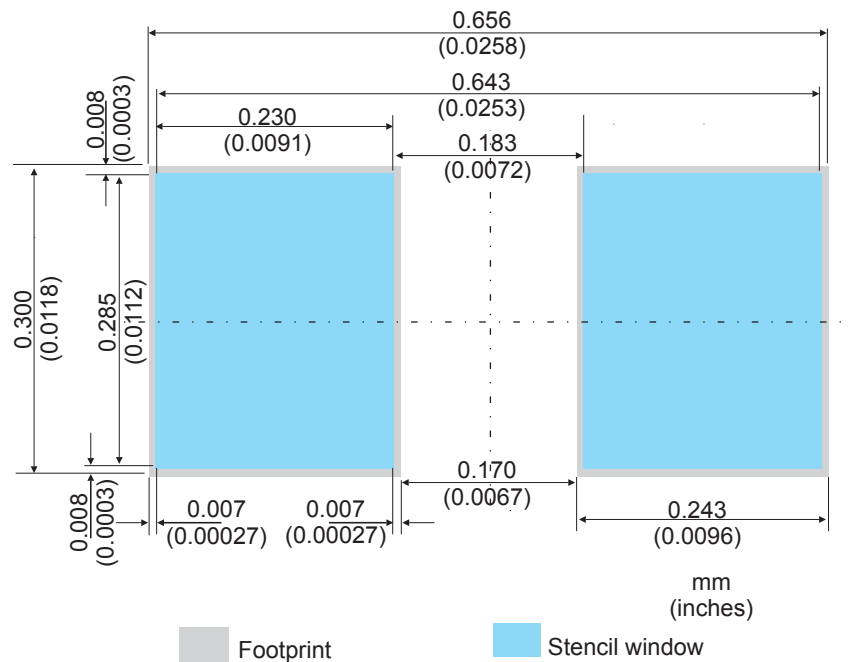

1. General recommendation on stencil opening design
  - a. Stencil opening dimensions: L (Length), W (Width), T (Thickness).

**Figure 10. Stencil opening recommendation**

- b. General design rule
  - Stencil thickness (T) = 75 ~ 125 μm
  - $\frac{W}{T} \geq 1.5$
  - $\frac{L \times W}{2T(L + W)} \geq 0.66$
1. Reference design
  - a. Stencil opening thickness: 80 μm
  - b. Other dimensions: see below figure.

**Figure 11. Recommended stencil window position, stencil opening thickness: 80 μm**

### 3.2 Solder paste

1. Halide-free flux qualification ROL0 according to ANSI/J-STD-004.
2. “No clean” solder paste is recommended.
3. Offers a high tack force to resist component displacement during PCB movement.
4. Use solder paste with fine particles: Type 4 (powder particle size 20-48  $\mu\text{m}$  per IPC J STD-005).

### 3.3 Placement

1. Manual positioning is not recommended.
2. It is recommended to use the lead recognition capabilities of the placement system, not the outline centering
3. Standard tolerance of  $\pm 0.05$  mm is recommended.
4. 1.0 N placement force is recommended. Too much placement force can lead to squeezed out solder paste and cause solder joints to short. Too low placement force can lead to insufficient contact between package and solder paste that could cause open solder joints or badly centered packages.
5. To improve the package placement accuracy, a bottom side optical control should be performed with a high resolution tool.
6. For assembly, a perfect supporting of the PCB (all the more on flexible PCB) is recommended during solder paste printing, pick and place and reflow soldering by using optimized tools.

### 3.4 PCB design preference

1. To control the solder paste amount, the closed via is recommended instead of open vias.
2. The position of tracks and open vias in the solder area should be well balanced. A symmetrical layout is recommended, to avoid any tilt phenomena caused by asymmetrical solder paste due to solder flow away.

### 3.5 Reflow profile

**Figure 12. ST ECOPACK<sup>®</sup> recommended soldering reflow profile for PCB mounting**

*Note: Minimize air convection currents in the reflow oven to avoid component movement.*
