## FEATURES:

- Enhanced N channel FET with no inherent diode to Vcc
- Bidirectional signal flow
- 24:12 Mux/Demux switches connect inputs to outputs
- Individual controls for each bank
- Zero propagation delay, zero ground bounce
- Undershoot clamp diodes on all switch and control inputs
- TTL-compatible control inputs
- Available in 48-pin QVSOP package

## APPLICATIONS:

- Logic replacement
- Video, audio, graphics switching, muxing
- Hot-swapping, hot-docking
- Voltage translation (5V to 3.3 V )
- Bus funneling

## DESCRIPTION:

The QS33X257 is a high-speed CMOS TTL-compatible 24:12 multiplexer/demultiplexer. The QS33X257 is functionally compatible to three of the QuickSwitch version of the 74F257, 74FCT257, and the 74ALS/AS/ LS257 Quad 2:1 multiplexers. The low ON resistance of the QS33X257 allows inputs to be connected to outputs without adding propagation delay and without generating additional ground bounce noise. This part will be used in wide bus multiplexing where board space is at a premium.
Mux/Demux devices provide an order of magnitude faster speed than equivalent logic devices.
The QS33X257 is characterized for operation at $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$.

## ABSOLUTE MAXIMUM RATINGS(1)

| Symbol | Description | Max | Unit |
| :--- | :--- | :---: | :---: |
| VTERM $^{(2)}$ | Supply Voltage to Ground | -0.5 to +7 | V |
| VTERM $^{(3)}$ | DC Switch Voltage Vs | -0.5 to +7 | V |
| VTERM $^{(3)}$ | DC Input Voltage VIN | -0.5 to +7 | V |
| VAC | AC Input Voltage (pulse width $\leq 20 \mathrm{~ns}$ ) | -3 | V |
| Iout | DC Output Current Max. Sink Current/Pin | 120 | mA |
| Pmax | Maximum Power Dissipation | 0.5 | W |
| TstG | Storage Temperature | -65 to +150 | ${ }^{\circ} \mathrm{C}$ |

NOTE:

1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. $V c c$ terminals.
3. All terminals except Vcc.

|  |  |  |  |  |

## NOTES:

1. For conditions shown as Min. or Max., use the appropriate values specified under DC Electrical Characteristics.
2. Per TLL driven input ( $\mathrm{V}_{\mathrm{in}}=3.4 \mathrm{~V}$, control inputs only). I and Y pins do not contribute to $\Delta \mathrm{lcc}$.
3. This current applies to the control inputs only and represents the current required to switch internal capacitance at the specified frequency. The I and Y inputs generate no significant AC or DC currents as they transition. This parameter is guaranteed but not production tested.

| $\begin{gathered} \text { tPLZ } \\ \text { tPHZ } \end{gathered}$ | Switch Turn-offDelay ${ }^{(2)}$ Ex to $Y$, Sx to Y | 0.5 | - | 5 | ns |

NOTES:

1. Minimums are guaranteed but not production tested.
2. This parameter is guaranteed but not production tested.
3. The bus switch contributes no propagation delay other than the RC delay of the ON resistance of the switch and the load capacitance. The time constant for the switch alone is of the order of 0.25 ns for $\mathrm{CL}=50 \mathrm{pF}$. Since this time constant is much smaller than the rise and fall times of typical driving signals, it adds very little propagation delay to the system. Propagation delay of the bus switch, when used in a system, is determined by the driving circuit on the driving side of the switch and its interaction with the load on the driven side.
