OV7640 Color CMOS VGA (640 x 480) CAMERACHIP™
OV7141 B&W CMOS VGA (640 x 480) CAMERACHIP™

General Description

The OV7640 (color) and OV7141 (black and white) CAMERACHIPS™ are low voltage CMOS image sensors that provide the full functionality of a single-chip VGA (640 x 480) camera and image processor in a small footprint package. The OV7640/OV7141 provides full-frame, sub-sampled or windowed 8-bit images in a wide range of formats, controlled through OmniVision's Serial Camera Control Bus (SCCB) interface.

This product family has an image array capable of operating at up to 30 frames per second (fps) with complete user control over image quality, formatting and output data transfer. All required image processing functions, including exposure control, gamma, white balance, color saturation, hue control and more, are also programmable through the SCCB interface. In addition, OmniVision CAMERACHIPS use proprietary sensor technology to improve image quality by reducing or eliminating common lighting/electrical sources of image contamination such as fixed pattern noise, smearing, blooming, etc. to produce a clean, fully stable color image.

Features

- High sensitivity for low-light operation
- 2.5V operating voltage for embedded portable applications
- Standard Serial Camera Control Bus (SCCB) interface
- VGA, QVGA (sub-sampled) and Windowed outputs with Raw RGB, RGB (GRB 4:2:2), YUV (4:2:2) and YCbCr (4:2:2) formats
- Automatic image control functions including: Automatic Exposure Control (AEC), Automatic Gain Control (AGC), Automatic White Balance (AWB), Automatic Brightness Control (ABC), Automatic Band Filter (ABF) for 60Hz noise and Automatic Black-Level Calibration (ABLC)
- Image quality controls including color saturation, hue, gamma, sharpness (edge enhancement), anti-blooming and zero smearing

Functional Description

Figure 2 shows the functional block diagram of the OV7640/OV7141 image sensor. The OV7640/OV7141 includes:

- Image Sensor Array (640 x 480 resolution)
- Timing Generator
- Analog Processing Block
- A/D Converters
- Output Formatter
- Digital Video Port
- SCCB Interface

Figure 2 OV7640/OV7141 Functional Block Diagram

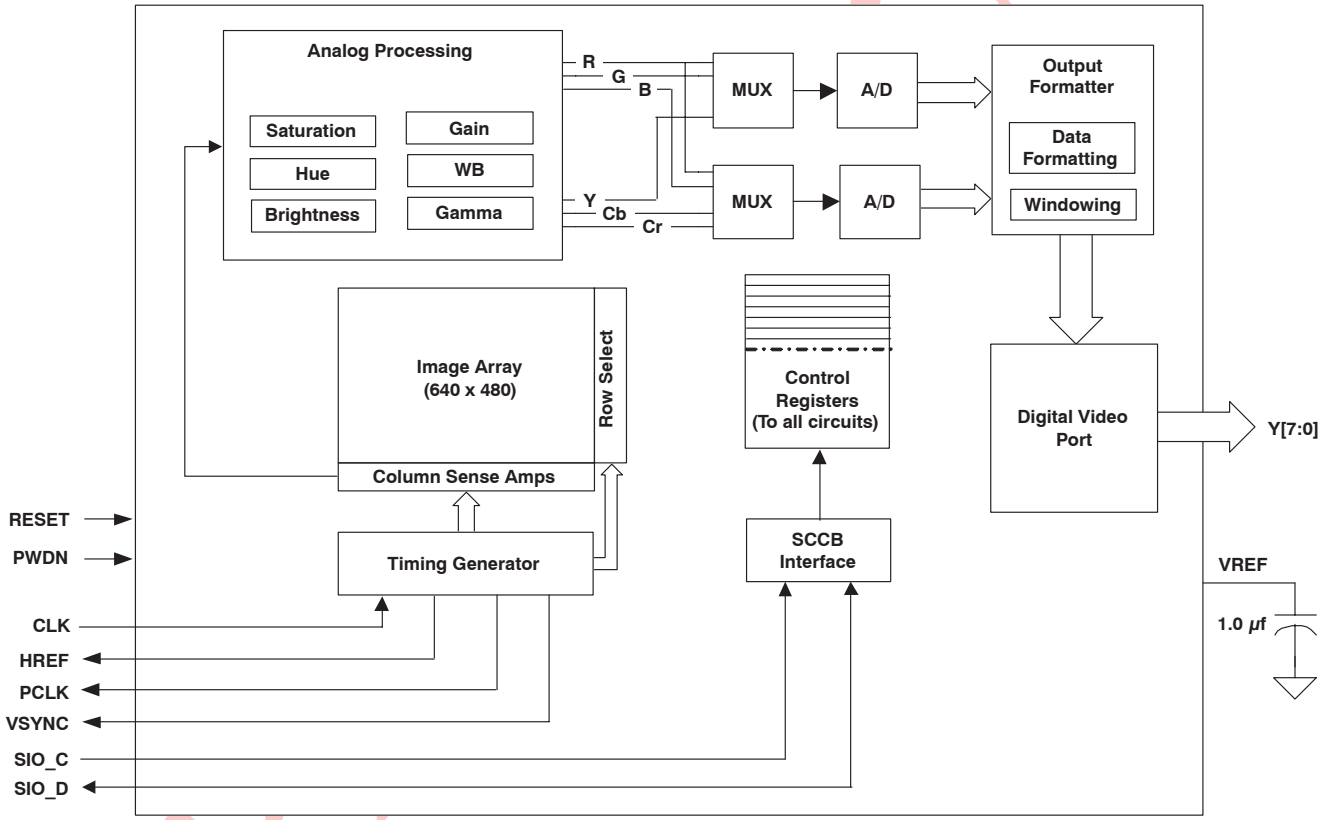

Image Sensor Array

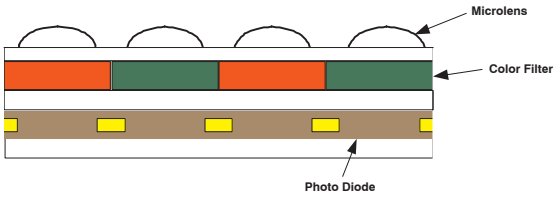
The OV7640/OV7141 CAMERACHIPS has an active image array size of 640 columns x 480 rows (307,200 pixels). However, the full array contains 652 columns and 486 rows, with the extra 6 rows used for black-level calibration ("Optical Black") and color interpolation information. Figure 3 shows a cross-section of the image sensor array.

Figure 3 Image Sensor Array



Timing Generator

In general, the timing generator controls these functions:

- Array control and frame generation (VGA and QVGA outputs)
- Internal timing signal generation and distribution
- Frame rate timing
- Automatic Exposure Control (AEC)
- External timing outputs (VSYNC, HREF and PCLK)

Analog Processing Block

This block performs all analog image functions including:

- Automatic Gain Control (AGC)
- Automatic White Balance (AWB)
- Image quality controls including:
  - Color saturation
  - Hue
  - Gamma
  - Sharpness (edge enhancement)
  - Anti-blooming
  - Zero smearing

A/D Converters

After the Analog Processing Block, the color channel data signal is fed to two 8-bit Analog-to-Digital (A/D) converters via the multiplexers, one for the Y/G channel and one shared by the CrCb/BR channels. These A/D converters operate at speeds up to 12MHz, and are fully synchronous to the pixel rate (actual conversion rate is related to the frame rate).

In addition to the A/D conversion, this block also has the following functions:

- Digital Black-Level Calibration (BLC)
- Optional U/V channel delay
- Additional A/D range controls

In general, the combination of the A/D Range Multiplier and A/D Range Control sets the A/D range and maximum value to allow the user to adjust the final image brightness as a function of the individual application.

Output Formatter

This block controls all output and data formatting required prior to sending the image out.

Digital Video Port

These two bits increase I_{OL} / I_{OH} drive current and can be adjusted as a function of the customer's loading:

SCCB Interface

The Serial Camera Control Bus (SCCB) interface controls the CAMERACHIP operation. Refer to *OmniVision Technologies Serial Camera Control Bus (SCCB) Specification* for detailed usage of the serial control port.

Note: As the RGB, YUV and YCbCr formats use the Bayer pattern for interpolation, the first row transferred out on the Y[7:0] bus will be invalid, as there is no row above Row #1 to provide the 'pair data' required. Because of this, the OV7640 does not enable the HREF signal during the first row read (shown above in the 'invalid data' zone).
